1. To reduce the likelihood of COVID-19 spreading from one location to another, movement shall be limited to that which is necessary for clinical care, medical isolation or quarantine, reduction of overcrowding, and serious custody concerns.

Necessary movement includes but is not limited to:

a) movement of MHSDS patients as required by the Program Guide,
b) transfers in and out of restricted housing units,
c) transfers for medical inpatient (CTC, OHU, SMB) placement or to facilitate access to specialty services,
d) transfers of people with disabilities impacting placement (including DPP and DDP individuals),
e) transfers to address personal safety concerns, and
f) transfers for placement in camps and community-based facilities

g) transfers to facilitate parole

2. Transfer-related COVID-19 screening consists of a verbal symptom questionnaire and temperature screening.

3. All COVID-19 testing shall be by Polymerase Chain Reaction (PCR) unless specifically stated otherwise.

4. When rapid point of care (POC) testing is utilized, one positive rapid POC will preclude movement. Isolate the patient in a solid door single cell and obtain a PCR test as soon as possible, preferably within 24 hours. A negative PCR test and no evidence for active COVID on clinical assessment will be required before movement is allowed.

5. Patients and transportation staff shall wear KN95 masks during transfer. Masks shall cover the nose, mouth, and chin. Transportation vehicles shall be operated at no more than 75% occupancy and shall be disinfected after each trip.

6. Every effort shall be made to avoid layovers during transportation. If a layover is essential, patients shall layover in cell-based housing and only be housed with others coming from the same location at the same time.

7. Transfer-related quarantine shall be utilized for all patients transferring from one institution to another location. Transfer-related quarantine of all patients shall take place post-transfer in the receiving institution, except in limited circumstances when patients are instead placed on pre-transfer quarantine. Pre-transfer quarantine is required for all patients transferring to, ACP, CCTRP, MCRP, or a fire camp.

8. Post-transfer quarantine of all patients shall take place in celled housing with a solid door. Facilities which by design have no cell-based housing (SQ, FSP, ASP, CVSP, CRC, CMC-West, or CIM FAC-A and D) shall conduct post-transfer quarantine of patients in cohorts of no more than 20 patients in a dorm solely dedicated to a cohort that arrived on the same day from the same location to the same unoccupied dorm at the receiving institution.
9. Vaccinated patients are those who are at least 14 days post receiving the second dose of a 2-dose RNA vaccine series (Moderna or Pfizer) or 14 days after the only dose of a single-dose vaccine (Johnson & Johnson).

10. Unvaccinated patients are those who have:
   a) received no COVID vaccine, or
   b) received a partial vaccine series, or
   c) completed a vaccine series but are <14 days post completing the series.

11. Symptomatic patients shall be isolated alone in celled housing with a solid door and tested for COVID-19.

12. Patients with a PCR-confirmed diagnosis of COVID-19 may be housed together as a cohort on isolation status.

13. Movement of COVID-resolved patients shall be subject to the same testing and quarantine requirements as COVID-naive patients.

14. Patients with COVID risk scores of three or more who have not completed the COVID vaccine shall only be housed in cells with solid front doors, shall not be moved to dorm settings and shall not transfer to SQ, FSP, ASP, CVSP, CRC, CMC-West, or CIM FAC-A and D.

15. Patients who have completed the COVID vaccination may be housed in dorm settings and may be housed at SQ, FSP, ASP, CVSP, CRC, CMC-West, or CIM FAC-A and D, regardless of COVID risk score.

16. The minimum length of transfer-related quarantine is 10 days. Testing for release from transfer-related quarantine shall occur no earlier than day 10 with release as soon as the PCR result returns negative provided the patient remains asymptomatic.

17. Some institutions do not have Administrative Segregation Units (ASU) and must temporarily transfer patients to neighboring institutions for ASU placement (i.e. ASP sends to PVSP, CRC sends to CIM, CTF sends to SVSP and CVSP sends to ISP). When the ASU institution needs to transfer these patients back to their original institution, the sending institution can administer a POC test within 24 hours of transfer in lieu of the PCR test 5 days prior to transfer. This is to ensure the patients can be returned to the original institution in a timely manner and avoid having to wait for PCR results. (see * on Page 4 under “General population movement from one institution to another, including to camp hubs; movement from ASU/STRH/LTRH/SHU to another facility.)

Disposition to be determined by CME at the institution. |
ISOLATION AND QUARANTINE GENERAL PRINCIPLES

At a number of institutions, including ASP, CRC, CVSP, FSP and SQ, the available facilities are insufficient to achieve some basic isolation and quarantine standards. In those institutions, post-exposure quarantining in groups of larger than two patients may be necessary. All efforts should be made at these institutions to find quarantine alternatives that satisfy the purposes of a post-exposure quarantine as set forth below.

Decisions about post-exposure quarantine housing at CHCF and CMF are committed to the discretion of the medical leadership at those institutions in recognition of the materially different missions and operations at those two facilities. CHCF and CMF shall maintain their minimum quarantine set-aside beds.

At institutions experiencing an outbreak where the number of COVID positive patients exceeds 200 or the number of patients who should be quarantined exceeds the number of beds set aside at that institution for quarantine, decisions about post-exposure quarantine and housing shall be committed to the discretion of the warden and CEO or their designees at the institution in consultation with CDCR and CCHCS regional and headquarters staff.

Refusals of patients to undergo necessary COVID testing and/or movement to isolation or quarantine space shall be promptly elevated to the warden and CEO who shall discuss their plans of action with the regional health care executive and AD.

ISOLATION: GENERAL PRINCIPLES

Patients who are in isolation shall:

- Remain in their isolation location unless approved by clinical staff to move elsewhere
- Be medicated and fed in their isolation location
- Shall receive clinical care in their isolation location
- Shall not share showers or toilets with those who are not infected
- Shall wear an N95 mask at all times when outside of their cell

ISOLATION OF INFECTED PATIENTS AND ISOLATION OF SYMPTOMATIC PATIENTS WHO ARE AWAITING TESTING

1. **Isolation of patients who are infected with COVID-19**
   a. All infected patients shall be promptly moved to appropriate isolation housing.
   b. Asymptomatic patients who were diagnosed solely based upon a rapid test shall be isolated apart from others until the rapid test is confirmed by a PCR test.
   c. Infected patients shall not be housed with patients who are not confirmed to have COVID-19.
   d. Infected patients can be housed in congregate living sites with other COVID-19 infected patients.
   e. Twice daily health care monitoring shall be conducted for patients diagnosed with COVID-19.
   f. All staff interacting with COVID-19 infected patients shall wear an N95 mask, eye protection, and, when in direct contact, gloves and gowns.

2. **Isolation of symptomatic patients who are being evaluated for COVID-19 infection**
   a. Symptomatic patients who have not yet been confirmed to have COVID-19 shall be isolated separately from confirmed COVID-19 patients and separately from those who are not symptomatic.
   b. Twice daily health care monitoring shall be conducted for symptomatic patients who are awaiting diagnosis.
   c. All staff interacting with symptomatic isolated patients shall wear an N95 mask, eye protection, and, when in direct contact, gloves and gowns.
QUARANTINE OF PATIENTS WHO HAVE BEEN EXPOSED TO COVID-19, AND PRE OR POST-TRANSFER QUARANTINE

1. **Quarantine of Patients who have been Exposed to COVID-19:**
   a. These patients are at risk of being infected as a result of their exposure. Thus, they shall be separated from both the confirmed cases and from the symptomatic but not yet confirmed cases.
   b. For individual cases, the preference is for quarantine in a single cell with a solid, closed door.
   c. Exposed persons shall not be housed in dorms with those who are not known to be exposed.
   d. If single cells are not available, persons with the same exposure can be quarantined together as a cohort.
   e. During large outbreaks, quarantine in place may be preferable to moving patients to alternate housing areas.
   f. If cohorting is essential, quarantine cohorts shall be as small as possible.
   g. Daily healthcare monitoring shall be conducted for patients who are under quarantine.
   h. Serial testing and healthcare surveillance is used to identify those who are infected so that they can be moved to isolation.
   i. Patients shall not be released from quarantine until they have completed 10 days of quarantine and tested negative for COVID-19 by PCR. If testing is refused, quarantine shall be extended to 21 days.
   j. Any patient who develops symptoms shall be placed in isolation alone and tested for COVID-19.

2. **Transfer-related quarantine**
   a. Transfer-related quarantine shall be utilized for all patients transferring from one institution to another.
   b. Transfer-related quarantine shall take place post-transfer in the receiving institution, except in limited circumstances when patients are instead placed on pre-transfer quarantine. Pre-transfer quarantine shall only be utilized when transferring to MCCF, ACP, CCTRP, MCRP, or a fire camp.
   c. Post-transfer quarantine shall take place in celled housing with a solid door. Facilities which by design have no cell based housing (SQ, FSP, ASP, CVSP, CRC, CMC-West, or CIM FAC-A and D) shall conduct post-transfer quarantine in cohorts of no more than 20 in a dorm solely dedicated to a cohort that arrived on the same day from the same location to the same unoccupied dorm at the receiving institution.
   d. Cohorts of patients with different movement dates shall not be housed together during post transfer quarantine.
   e. Cohorts of patients coming from different locations shall not be housed together during post transfer quarantine.
   f. May release patients from quarantine if asymptomatic and both COVID-19 tests from days 5 and 10 are negative. If testing is refused, quarantine shall be extended to 21 days.
   g. Any patient who develops influenza like symptoms should be placed in isolation alone and tested for COVID-19.
